

To recap, daily use of Cuprident™ containing MCC offers these beneficial effects:

- Blockage of the adherence of plaque to the teeth,
- Neutralization of toxins associated with calculus development,
- Reduction of existing inflammation, arrest of bleeding gums,
- Improvement of gum health due to SOD activity,
- Elimination of bad breath by both direct and catalytic action.

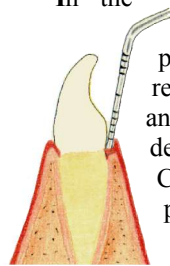

Cuprident™ does not contain fluoride but is compatible with fluoride. If a fluoride dentifrice is desired, alternate its use with Cuprident™ to obtain the benefits of both.

Use a soft-bristled brush, one or two times per day to apply Cuprident™ to the surfaces of the teeth. Use of a hard brush can damage both gums and the tooth, exposing them to bacterial attack.

Cuprident™ reduces but does not entirely eliminate plaque formation. Consult your dentist regularly for examinations and professional care.

In the case of gingivitis, it is highly recommended that a dental professional be consulted for removal of calculus from the teeth and below the gumline. Many dentists have prescribed and used Cuprident™ in their practices to prevent calculus formation, as a treatment after gingivectomy and for treating a variety of dental disorders.

Completely natural, Cuprident™ with MCC offers dental health without the use of toxic antibacterial agents.
